EXECUTIVE PITCH DECK & LIVE DEMO SCRIPT

ParkOrbit.in

Peer-to-Peer Decentralized Urban Parking Marketplace for Tier-1 Indian Metros (Pune Pilot)

TARGET CITY

Pune Metropolitan Area (18.40°N–18.65°N, 73.70°E–74.00°E)

PRESENTATION FORMAT

4-Person Synchronized Team Pitch & Live Interactive Demo

CORE TECHNOLOGY

Next.js 15, React 19, Leaflet + Carto Voyager, Real-Time Sync

BUSINESS MODEL

17% Marketplace Net Take-Rate (12% Host + 5% Driver Fee)

PITCH TEAM ROSTER & ROLE DIVISION

Srujan	**Speaker 2**	**Speaker 3**	**Speaker 4**
Speaker 1: Narrative Storyteller & Problem Intro (Hook Only)	Heavy Lifter 1: Crisis Stats, Architecture & Driver Map Demo	Heavy Lifter 2: Host Yield, Dynamic Pricing & Live Booking Sync	Heavy Lifter 3: Trust & Safety, Scale, Unit Economics & Q&A Lead

1 Executive Story & The Urban Parking Paradox

Every single morning across India's booming tier-1 metros, millions of productive hours and crores of rupees worth of fuel dissolve into thin air as commuters circle city blocks searching for parking. Meanwhile, right behind private society gates and commercial buildings, millions of square feet of parking real estate sit entirely vacant and locked away.

Persona A: The Commuter (Rahul Mehta)
Rahul is a 28-year-old tech consultant driving from Kothrud to an urgent client review in Hinjewadi Phase 1. He reaches the office corridor in 45 minutes, only to spend the next **35 minutes** trapped in crawling traffic hunting for a roadside spot. He risks police towing, arrives sweating and agitated, and starts his pitch on the back foot.

Persona B: The Private Host (Mrs. Neha Kulkarni)
Just 250 meters from the Hinjewadi tech hub, Mrs. Kulkarni lives in a gated bungalow. With her children working in Germany, her two covered carports remain empty **16 hours a day**. She would love passive income of ₹15,000/month, but lacks a secure, digital platform that guarantees verified drivers and controlled gate check-in.

The ParkOrbit Value Proposition:
ParkOrbit bridges this exact chasm. We transform idle, privately held driveway bays and residential lots into an on-demand, peer-to-peer parking network. Drivers reserve verified parking in seconds via interactive maps with guaranteed gate check-in codes; property owners monetize unused square footage with automated payouts and zero operational headache.

42 min AVG. DAILY PARKING SEARCH IN PUNE	**30%** OF CITY CONGESTION CAUSED BY PARKING CRUISING
₹1,200 Cr ANNUAL WASTED FUEL & CARBON COST IN PUNE	**17%** PLATFORM TAKE-RATE (ASSET-LIGHT SAAS)

2 Synchronized 4-Person Pitch Script

Each speaker must follow their allotted timing and verbal cues. Demo screens must be kept on full screen with the Segmented Persona Switcher visible at the top right of the navigation bar.

Speaker 1: Srujan

`0:00 - 1:15 (75 seconds)`

Co-Founder & Storytelling Lead • Sole Responsibility: Hook, Narrative & Problem Setup

"Good morning, esteemed judges, mentors, and fellow innovators. Picture this scene: It is 9:15 on a Monday morning in Pune.

Meet **Rahul**. Rahul has just driven 45 minutes through Pune traffic for an urgent client review in Hinjewadi. He reaches the office complex on schedule—only to spend the next **35 agonizing minutes** circling congested lanes looking for anywhere to leave his car. The official lot is full; roadside spots are illegal; and commercial garages are charging ₹150 an hour. Rahul ends up parking 1.5 kilometers away, stressed, sweating, and 20 minutes late to his career-defining presentation.

Now, let's pan the camera just 300 meters away into a peaceful residential lane. Meet **Mrs. Kulkarni**. Her children have moved abroad, and her covered, gated driveway has two spacious parking bays that sit completely empty for 14 hours every single day. She has prime, high-demand real estate, but zero safe, trusted way to monetize it.

This is the great urban paradox of India: millions of desperate drivers burning fuel searching for parking, right next to millions of locked, empty private driveways.

We built **ParkOrbit** to solve this. ParkOrbit is Pune's first peer-to-peer urban parking marketplace, connecting everyday drivers with verified private spaces in real time.

To explain the staggering technical and economic data behind this crisis—and to show you our live discovery engine—let me hand it over to our technical co-founder, **[Speaker 2]**."

DEMO ACTION: Srujan stands front and center, hands free, commanding eye contact. Laptop screen is open on `http://localhost:3000` showing the Hero Leaflet Map with Pune price pins. Srujan points to the screen as he introduces Rahul and Mrs. Kulkarni.
WHAT NOT TO DO: Srujan does NOT click buttons or navigate pages. He focuses 100% on verbal storytelling and sets the emotional stage.

Speaker 2: Heavy Lifter 1

`1:15 – 3:00 (105 seconds)`

Systems & Geospatial Architecture Lead • Market Data, Architecture & Driver Discovery Demo

"Thank you, Srujan. Let's talk about the hard numbers. In Pune alone, there are over **1.2 million registered four-wheelers**, growing at 8% year-over-year. Independent urban mobility audits reveal that **30% of peak-hour vehicular traffic** is caused entirely by vehicles cruising for parking spots. That represents over **₹1,200 Crores in wasted fuel** and thousands of metric tons of toxic emissions trapped in our residential neighborhoods every single year.

Traditional parking systems fail because they rely on centralized sensor hardware that costs upwards of ₹50,000 per bay to install, or proprietary mapping APIs that charge exorbitant fees per map render.

ParkOrbit takes a radically modern, decentralized approach. Our platform is built on **Next.js 15 App Router** and **React 19**, backed by an open-source geospatial tile pipeline utilizing **Leaflet and Carto Voyager**. This delivers instantaneous, sub-100-millisecond map loading with zero external API costs.

Let's look at the live prototype on screen. As Rahul arrives on the homepage, he is greeted by an interactive, uncluttered map of Pune bounded between 18.40 and 18.65 degrees North. Notice how every single available parking space is marked with its exact, transparent price—₹75/hr in Koregaon Park, ₹60/hr on FC Road, ₹50/hr in Hinjewadi.

Watch what happens when I click the **'Hinjewadi'** neighborhood filter: the map smoothly animates with zero page reload, instantly calculating geospatial distances using the Haversine formula and re-ranking the closest verified driveways."

> **DEMO ACTION:** 1. Click on the **'Find parking'** tab or navigate to `/find`.
> 2. Click the neighborhood pill **'Hinjewadi'**. Show the Leaflet map smoothly pan/zoom to Hinjewadi Phase 1.
> 3. Click on the price pin **'₹50/hr'**. Show the listing preview popup opening with space photo, host rating (4.9★), and vehicle type badge (Sedan/SUV).
> **WHAT NOT TO DO:** Do not type arbitrary out-of-state addresses (e.g. Mumbai, Bangalore). Stay strictly within the authentic Pune hubs (Koregaon Park, Baner, Hinjewadi, FC Road, Kothrud).

"Now that Rahul has discovered an available private bay just 100 meters from his office, how does the marketplace execute the transaction, protect against double-booking, and pay Mrs. Kulkarni? To show you the live host workspace and dual-persona booking flow, here is **[Speaker 3]**."

Speaker 3: Heavy Lifter 2

`3:00 - 5:00 (120 seconds)`

Marketplace & Transaction Engine Lead • Host Onboarding, Dynamic Pricing & Live Booking Sync Demo

"Thank you, [Speaker 2]. Let's switch over to the supply side of our marketplace.

For property owners like Mrs. Kulkarni, ParkOrbit turns dead square footage into a predictable yield machine. A single residential driveway in Koregaon Park or Baner generates between **₹12,000 to ₹18,000 net monthly income**.

To demonstrate this live, look at the top-right corner of our navigation bar. We have engineered a **1-click Persona Switcher**. With a single click, I switch our active session to **'Host (Neha Kulkarni)'**.

Immediately, we enter the Host Workspace at `/dashboard/host`. Notice what Mrs. Kulkarni sees: her real-time earnings graph breaking down earned income versus scheduled income, live occupancy indicators, and her current reservations queue.

If Mrs. Kulkarni wants to list a second driveway or a commercial lot, she clicks **'List a space'**. Our interactive Location Picker lets her drop a draggable pin directly onto her bungalow gate, displays a real-time latitude/longitude coordinate HUD, and presets authentic Pune postal codes. She configures amenities like 24/7 CCTV and EV charging, sets her pricing, and publishes in under three minutes.

Now, let's execute the live Host-to-Driver booking lifecycle.

I switch personas back to **'Driver (Aarav Mehta)'**. Rahul opens the Koregaon Park listing. Notice our dynamic pricing engine in action: 4 hours at ₹75/hr computes to ₹300 base, with an automatic 5% driver platform fee. If Rahul books for 10 hours, our engine automatically triggers a daily cap at ₹480 instead of charging ₹750, protecting the commuter.

Rahul enters his license plate `MH-12-RN-4821` and clicks **'Confirm & Pay'** via simulated UPI.

Look at the screen: Instantly, a cryptographic **4-digit Check-in PIN (e.g. 8421)** is generated. Only now do the private gate access instructions unlock for Rahul.

And here is the technical highlight: I switch back to **'Host (Neha)'**. Notice that without touching the browser refresh button, Rahul's reservation has **instantly appeared in Mrs. Kulkarni's queue**! This is powered by our real-time cross-tab `BroadcastChannel` and event synchronization engine.

When Rahul arrives at the gate, he states his PIN. Mrs. Kulkarni inputs the PIN, clicks **'Verify & Check-in'**, and the status flips to **'Parked now'** with the host's earnings updated in real time."

DEMO ACTION: 1. Click **'Host (Neha)'** in navbar. Show Host Dashboard analytics and earnings graph.
2. Click **'Driver (Aarav)'** in navbar. Open Koregaon Park listing (`/listings/listing-koregaon-park-1`).
3. Click **'Confirm & Pay'**. Note the 4-digit PIN displayed on the modal (e.g. `8421`).
4. Click **'Host (Neha)'** in navbar. Show the reservation in arrivals queue without manual reload.
5. Enter the exact 4-digit PIN and click **'Verify PIN'**. Show toast confirmation and status badge updating to 'Parked now'.
WHAT NOT TO DO: Do not mistype the PIN. Read the exact 4 digits from the Driver confirmation modal.

"To explain our platform governance, technical scalability, unit economics, and to lead our Q&A defense, let me hand it over to **[Speaker 4]**."

Speaker 4: Heavy Lifter 3

`5:00 - 7:00 (120 seconds)`

Trust, Scalability & Financial Lead • Admin Moderation Demo, Unit Economics & Cross-Q Defense

"Thank you, [Speaker 3]. A decentralized peer-to-peer marketplace succeeds or fails on one single foundation: **Trust, Safety, and Governance**.

Let's switch our session to **'Admin (Nandini Sharma)'** and navigate to `/admin`.

In the Trust & Safety Console, platform moderators have real-time visibility into any flagged listings or community reports. If a host misrepresents parking bay dimensions or blocks access unexpectedly, a driver can submit a report. With a single click, an admin can resolve the report and **immediately suspend the offending listing** from public search results across the entire city.

Furthermore, notice the **Dynamic Platform Commission control**. As platform administrators, we can tune the marketplace take-rate in real-time. If I adjust our commission from 12% to 15% and click 'Update', every future booking calculation across the platform dynamically re-indexes without requiring a redeployment or server restart.

Now let's look at our **Unit Economics and Financial Viability**:

ParkOrbit operates an asset-light, two-sided transaction model: We take a **12% host monetization commission** plus a **5% driver platform convenience fee**, yielding a net **17% platform take-rate**.
On an average Pune 4-hour reservation at ₹60/hour: The driver pays ₹252; the host earns ₹211; and ParkOrbit clears **₹41 net margin per transaction**. Because we own zero real estate, lease zero parking lots, and deploy zero costly on-ground hardware, our marginal cost per transaction is virtually zero.

Under the hood, our system enforces strict **concurrency protection**: every reservation runs an atomic interval intersection query to prevent double-booking, and our microservice architecture is ready to interface with society RFID FASTag gates and automated boom barriers.

In summary: ParkOrbit converts wasted residential concrete into recurring wealth for homeowners, and converts parking agony into predictable, seamless peace of mind for drivers.

Thank you so much. My team and I are now eager to answer any cross-questions from the jury!"

DEMO ACTION: 1. Click **'Admin (Nandini)'** in navbar. Show the Trust & Safety Console at `/admin`.
2. Point out the open reports table. Click **'Flag & Suspend'** on a sample report. Show instant toast notification.
3. Highlight the **Platform Commission Rate** card. Show how it controls live marketplace fees.
4. End with all 4 presenters standing confidently shoulder-to-shoulder, ready for judge Q&A.
WHAT NOT TO DO: Do not close the browser tab. Leave the app open so you can tab back to any screen during cross-questions.

3 Step-by-Step Live Demo Execution Blueprint

This table provides the exact cue sheet for the laptop operator. Follow the sequence strictly to maintain flawless synchronization with the speakers.

Time	Speaker	Screen & Route	Exact Clicks / Actions	What NOT to Do
0:00 – 1:15	**Srujan**	`/` (Driver Landing)	• Have browser full-screen at `http://localhost:3000`. • Ensure Persona is **'Driver (Aarav)'**. • Keep map centered on Pune.	**Do NOT click anything.** Let Srujan establish the narrative hook and introduce Rahul and Mrs. Kulkarni.
1:15 – 3:00	**Speaker 2**	`/find` (Discovery Map)	• Click **'Find parking'** in navbar. • Click **'Hinjewadi'** locality chip. • Click the **'₹50/hr'** price marker on the map. • Show popup preview card with ratings.	**Do NOT type random cities** like Mumbai or Delhi. Stay strictly within authentic Pune localities (Hinjewadi, Baner, KP).
3:00 – 4:00	**Speaker 3**	`/dashboard/host` & `/host/new`	• Click **'Host (Neha)'** in navbar dock. • Point to the daily earnings bar chart. • Click **'List a space'**. • Drag the pin on the map to show coordinate HUD. • Click back to dashboard.	**Do NOT submit an incomplete listing form** during the presentation; just showcase the interactive picker and presets.
4:00 – 5:00	**Speaker 3**	`/listings/...` & `/dashboard/host`	• Click **'Driver (Aarav)'** in navbar. • Open Koregaon Park listing. • Show price breakdown & daily cap note. • Click **'Confirm & Pay'**. • Read the 4-digit PIN aloud (e.g. `8421`). • Click **'Host (Neha)'** in navbar. • Point out new reservation appeared without reload! • Enter PIN and click **'Verify PIN'**.	**Do NOT forget the 4-digit PIN** generated on the driver modal. Write it down or read it immediately.
5:00 – 6:30	**Speaker 4**	`/admin` (Trust Console)	• Click **'Admin (Nandini)'** in navbar. • Navigate to `/admin`. • Show open moderation reports. • Click **'Flag & Suspend'** on a sample report. • Show live commission slider (12% to 15%).	**Do NOT switch to a non-admin account** while on `/admin` to avoid the role-lock message.
6:30 – 7:00	**All 4**	`/` or `/find`	• Navigate back to `/find` showing full Pune discovery map.	**Do NOT close browser**. Keep dev tools closed and

Time	Speaker	Screen & Route	Exact Clicks / Actions	What NOT to Do
			• All 4 presenters face judges for Q&A.	prototype live for rapid demo answers during jury questions.

4 Cross-Question Defense Playbook (Judge Q&A)

Anticipate the 10 most challenging technical, legal, security, and business cross-questions from judges and venture evaluators.

Q1: Legal & Municipal

Can housing societies (RWAs) or the Pune Municipal Corporation (PMC) ban homeowners from renting parking bays?

Direct Answer: Under the Maharashtra Co-operative Societies Act and recent Maharashtra RERA guidelines, while common-area visitor parking cannot be commercialized, *independent private bungalows, open driveways, and demarcated stilt parking bays with individual ownership rights* can be shared under peer-to-peer licensee agreements. Furthermore, urban transport authorities worldwide actively support P2P parking under TDM (Transportation Demand Management) policies because it reduces roadside congestion without spending public tax capital on multistory lots. For cooperative societies, ParkOrbit offers an **'RWA Revenue-Share Module'**, where 5% of host earnings go directly into the society maintenance corpus, turning RWAs from opponents into enthusiastic platform partners.

PRIMARY RESPONDER: SPEAKER 4 (ECONOMICS & GOVERNANCE)

Q2: Security & Gate Access

How do you prevent unauthorized strangers from entering residential society gates or wandering into private compounds?

Direct Answer: We employ a three-tier defense: First, **address and gate code obfuscation**—the exact bungalow number, landmark gate codes, and access notes remain cryptographically encrypted until a driver completes a KYC-linked UPI transaction. Second, the **4-digit Check-In PIN**—the driver must present this one-time code to the host or security guard at arrival, matching their registered license plate (e.g. `MH-12-RN-4821`). Third, **time-gated access**—the pass automatically expires at the reservation end time, triggering automated security SMS notifications if an overstay occurs.

PRIMARY RESPONDER: SPEAKER 3 (MARKETPLACE ENGINE)

Q3: Concurrency & Double Booking

What happens if two drivers attempt to reserve the exact same parking bay at 10:00 AM simultaneously?

Direct Answer: Our booking engine implements **atomic timestamp interval intersection validation**. Before writing any booking record, our database layer queries all active bookings and blocked periods for the target listing using the inequality condition: `(existing_start < new_end) AND (new_start < existing_end)`. If an overlap is detected, the transaction aborts with an immediate `409 Conflict` error. In our distributed production roadmap, we back this with Redis distributed mutex locks (Redlock) keyed by `listing_id`, ensuring strict serializability with zero double-booking possibility under concurrent spikes.

PRIMARY RESPONDER: SPEAKER 2 (ARCHITECTURE & SYSTEMS)

Q4: Overstaying & Vehicle Abandonment

What happens if a driver refuses to vacate the spot or disappears for two days?

Direct Answer: We have an explicit **Overstay Escalation Protocol** built into our user terms. When a reservation reaches 15 minutes before expiry, the driver receives automated WhatsApp and push notifications to extend their booking. If the driver overstays without authorization, the system automatically bills an overstay penalty at **2.5× the standard hourly rate** directly from their linked payment instrument, with 80% credited directly to the inconvenienced host. After 3 hours of non-response, our Trust & Safety team dispatches our partnered local towing service to impound the vehicle under municipal parking bye-laws.

PRIMARY RESPONDER: SPEAKER 4 (GOVERNANCE & TRUST)

Q5: Liability & Vehicle Damage

Who is responsible if a tree branch falls on a car, or if a driver accidentally hits the host's gate?

Direct Answer: Every confirmed ParkOrbit reservation includes a baseline **Host Protection Guarantee** up to ₹25,000 for verified property damage caused by a guest vehicle, underwritten in partnership with third-party micro-insurers (e.g., Digit / Acko). For vehicular damage, third-party comprehensive auto insurance remains primary by Indian motor vehicle law, but ParkOrbit requires photo verification of bay clearance prior to check-in, creating an immutable time-stamped visual audit trail for insurance claims.

PRIMARY RESPONDER: SPEAKER 4 (ECONOMICS & GOVERNANCE)

Q6: Competition (Park+, Fastag, Google Maps) **Why can't giants like Park+ or Google Maps crush you overnight?**

Direct Answer: Park+ and commercial operators focus almost exclusively on *commercial mall parking and FASTag toll payments*—they require expensive boom-barrier hardware and long sales cycles with commercial developers. They have zero presence in the decentralized peer-to-peer residential space. Google Maps provides navigation, not transactional marketplace reservation or gate access. ParkOrbit is the **'Airbnb of Driveways'**—our moat is hyper-local residential supply density, trusted RWA relationships, and frictionless zero-hardware check-in.

PRIMARY RESPONDER: SPEAKER 1 (SRUJAN - STRATEGY & VISION)

Q7: Mapping Costs & Open Source Stack **Why did you choose Leaflet and Carto Voyager over Google Maps API?**

Direct Answer: Google Maps Dynamic Maps JavaScript API costs approximately $7 per 1,000 loads after the tiny free tier. For a marketplace generating 100,000 monthly active driver searches, that is ₹60,000+ per month in pure API burn before making a single rupee of profit. By utilizing **Leaflet with Carto Voyager raster tiles**, we achieved sub-100ms tile caching, zero vendor lock-in, zero API bills, full custom CSS pin styling, and zero risk of unexpected billing spikes while maintaining retina-grade map aesthetics.

PRIMARY RESPONDER: SPEAKER 2 (ARCHITECTURE LEAD)

Q8: Two-Sided Marketplace Liquidity **How do you solve the chicken-and-egg problem of getting hosts before drivers exist?**

Direct Answer: We use the **'Anchor Corridor Wedge' strategy**. Instead of launching across all of Pune at once, we target high-density 500-meter commercial corridors (e.g. FC Road near Fergusson College, Hinjewadi Phase 1 IT Park, and Lane 5 Koregaon Park). We onboard 20-30 residential and commercial hosts within walking distance of high-deficit corporate hubs. We then partner directly with local IT companies and retail associations to provide guaranteed parking passes for employees, bootstrapping instant demand and providing immediate revenue to our early hosts.

PRIMARY RESPONDER: SPEAKER 3 (MARKETPLACE OPERATIONS)

Q9: Real-Time Synchronization Architecture **How does changes in one section reflect across tabs without manual page reload?**

Direct Answer: We architected a unified client synchronization module (`src/lib/sync.ts`) using two complementary browser communication layers: First, custom DOM events (`CustomEvent('parkorbit:datasync')`) for intra-tab state propagation. Second, the HTML5 **BroadcastChannel API** (`BroadcastChannel('parkorbit:channel')`) for instant inter-tab and inter-window synchronization. Coupled with the `useDataSync` hook listening to window focus and visibility transitions, any mutation (listing creation, booking, check-in, commission change) triggers immediate re-evaluation across all active screens with zero HTTP cache staleness (`cache: 'no-store'`).

PRIMARY RESPONDER: SPEAKER 2 (TECHNICAL ARCHITECTURE)

Q10: Long-Term Vision & EV Infrastructure **Where does ParkOrbit go after solving standard car parking?**

Direct Answer: Parking is our Trojan Horse; the ultimate prize is **decentralized EV charging infrastructure**. India's EV adoption is choked by a lack of accessible neighborhood chargers. Our prototype already supports the `15A EV Charging Point` amenity tag. In Phase 2, hosts can sell overnight 3.3kW slow charging to EV owners who lack personal parking bays, unlocking a recurring energy arbitrage revenue stream and positioning ParkOrbit as the largest decentralized virtual EV charging network in urban India.

PRIMARY RESPONDER: SPEAKER 1 (SRUJAN - VISION & FUTURE)

5 Unit Economics & Financial Projections

Per-Transaction Unit Economics (4-Hour Stay Example)
- Base Space Price: ₹60/hr × 4 hrs = **₹240.00**
- Driver Platform Fee (+5%): +₹12.00
- **Total Paid by Driver: ₹252.00**
- Host Platform Commission (-12%): -₹28.80
- **Net Paid to Host: ₹211.20**
- **Net ParkOrbit Platform Revenue: ₹40.80 (16.2% of GMV)**
- Payment Gateway Cost (UPI ~0%, Card ~1.5%): ~₹2.50
- **Net Contribution Margin: ₹38.30 (93.8% gross software margin)**

Host Earnings Case Study (Koregaon Park Bay)
- Daily Occupancy: 8 hours @ ₹75/hr = ₹600 gross/day
- Monthly Days: 22 working days/month = ₹13,200 gross
- Weekend Surge: 4 weekend days @ ₹700/day = ₹2,800 gross
- Total Monthly Gross Volume: ₹16,000
- Platform Commission (12%): -₹1,920
- **Host Net Passive Income: ₹14,080 / month**
- *Annual Host Yield: ₹1,68,960 with zero additional capital invested!*

Pune 3-Year Projections (Pilot to Scale)

Metric	Year 1 (Pilot: Pune Core)	Year 2 (Pune Metro Expansion)	Year 3 (Pune + Mumbai + Bengaluru)
Active Verified Parking Bays	850 spaces	4,200 spaces	18,500 spaces
Monthly Bookings Executed	28,000 bookings	180,000 bookings	950,000 bookings
Gross Booking Volume (GMV)	₹67.2 Lakhs / month	₹4.32 Crores / month	₹22.8 Crores / month
ParkOrbit Net Annual Revenue	**₹1.37 Crores**	**₹8.81 Crores**	**₹46.51 Crores**
Operating Margin (EBITDA)	-12% (Customer Acquisition)	+28% (Scale Efficiencies)	+44% (Dominant Network Effect)

Closing Pitch Summary for Evaluators:
ParkOrbit solves an urgent, daily pain point for millions of Indian drivers while unlocking billions in dead urban capital for residential and commercial hosts. With our live, responsive Next.js 15 prototype, zero-latency Leaflet map engine, instant cross-tab synchronization, and 93% contribution margin unit economics, ParkOrbit is primed to redefine urban mobility starting right here in Pune.
